

ANNEX 2: SAMPLE DISASTER RECOVERY AND BUSINESS CONTINUITY PLAN

This sample **Disaster Recovery and Business Continuity Plan (DRBCP)** is modeled for a **sample generic** National Government Agency (NGA) that manages both internal administrative systems and public-facing frontline services.

1. Plan Overview & Governance

Agency Name: National Bureau of Resource Management (NBRM - Generic Reference)

Version: 2026.1

Approval Date: March 15, 2026

Disaster Recovery Team (DRT)

Role	Responsibility	Contact
Incident Commander	Declares disaster and authorizes DR site activation.	Director, ICT Service
Infrastructure Lead	Restores servers, networks, and cloud connectivity.	Chief, Network Div.
Data/App Custodian	Ensures database integrity and application failover.	Lead Programmer
Security Officer	Monitors for cyber threats during the recovery phase.	CISO

2. Business Impact Analysis (BIA) Summary

The agency has identified the following criticalities for its ICT components:

System Name	Classification	RTO (Restoration Time)	RPO (Data Loss Limit)
Public Licensing Portal	Frontline / Mission-Critical	4 Hours	1 Hour

Integrated HR & Payroll	Administrative / Support	24 Hours	12 Hours
Official Website	Information / Support	8 Hours	24 Hours
Document Tracking	Support to Operations	48 Hours	24 Hours

3. ICT Component Inventory & Affected Assets

When a disaster (e.g., Fire at Central Office or a Ransomware Attack) occurs, the following assets are identified as at-risk:

- **Primary Data Center (Central Office):** 10 Physical Servers, 2 SAN Storage Units, Core Switches.
- **Connectivity:** 200Mbps Dedicated Internet Leased Line; GovNet Fiber Link.
- **Data Assets:** SQL Databases for 1.2M citizen records; 5TB of digitized PDF archives.
- **Power:** 100kVA Generator Set; 3 x 10kVA UPS Units.

4. Technical Recovery Strategy

NBRM utilizes a **Hybrid-Cloud Recovery Model** to ensure scalability and sustainability:

1. **Off-site Backup:** Daily encrypted backups are sent to a secondary physical site located in a different region (e.g., Cebu Regional Office).
2. **Cloud Failover (GovCloud):** Mission-critical applications (Licensing Portal) are replicated in real-time to the **DICT GovCloud**. In a disaster, traffic is rerouted via DNS update.
3. **Redundancy:** Dual ISP providers (PLDT/Globe) are configured in an active-passive setup to prevent connectivity loss.

5. Standard Operating Procedures (SOP)

Phase I: Detection and Declaration

- **Trigger:** System monitoring alerts or physical site damage report.
- **Action:** ICT Director evaluates the scale. If the RTO cannot be met at the primary site, the DRBCP is activated.

Phase II: Activation and Execution

- **Step 1:** Notify the DRT via SMS/Instant Messaging.
- **Step 2:** Redirect Public Portal URL to the **GovCloud DR Instance**.
- **Step 3:** Restore the latest "clean" database backup (RPO check).
- **Step 4:** Verify application functionality and security protocols (MFA/WAF).

Phase III: Failback (Return to Normal Operations)

- **Requirement:** Primary site is declared safe and stable.
- **Action:** Synchronize data changes made at the DR site back to the Primary Data Center. Schedule a maintenance window for the final switch-over to prevent data collision.

6. Maintenance and Sustainability

To comply with MITHI Resolution 2025-01 and SPAR Reporting:

- **Quarterly Backup Drills:** Randomly selecting one system to restore from backup to verify data readability.
- **Annual DR Simulation:** A full "shut-down" drill of the primary server to test GovCloud failover.
- **Budgetary Support:** Funding for off-site storage and cloud subscriptions is categorized under MOOE in Part IV of the ISSP (Object Code: *ICT Software Subscription*).
